## **Table of Content**

Executive Summary	02			
Number of Security Issues per Severity	03			
Checked Vulnerabilities	04			
Techniques and Methods	05			
Types of Severity	06			
Types of Issues	06			
High Severity Issues	07			
1. Blacklisted address is allowed to transfer tokens if allowance>0	07			
2. Any non-blacklisted address can transfer tokens to a blacklisted address	07			
3. The owner might mistakenly mint tokens to blacklisted address				
Informational Issues	80			
4. Experimental ABIEncoderV2 is deprecated	80			
5. Use the latest compiler version	09			
6. Unused Reentrancy contract import	09			
Automated Tests	10			
Closing Summary	10			
Disclaimer	10			

## **Executive Summary**

Project Name cNGN

Overview The Consortium eNaira (cNGN) smart contract is an ERC-20-

compliant decentralized application deployed on the Ethereum blockchain. Leveraging OpenZeppelin Contracts, it provides essential features such as pausability, blacklisting, minting,

burning, and ownership controls. The contract ensures the security and integrity of the cNGN stablecoin, which acts as a pioneering use case for the CBN eNaira. With a focus on blockchain's potential as an alternative global payment rail, the cNGN contract aligns with

the rising trend of blockchain adoption by governments and Fortune 500 companies.

Timeline 2nd January 2024 - 4th January 2024

**Updated code Received** 8th January 2024

Second Review 8th January 2024

Method Manual Review, Functional Testing, Automated Testing, etc. All the

raised flags were manually reviewed and re-tested to identify any

false positives.

Audit Scope The scope of this audit was to analyze the cNGN code for quality,

security, and correctness.

blob/4540e0958961307104265e0fdc4dd4449adbe614/contracts/

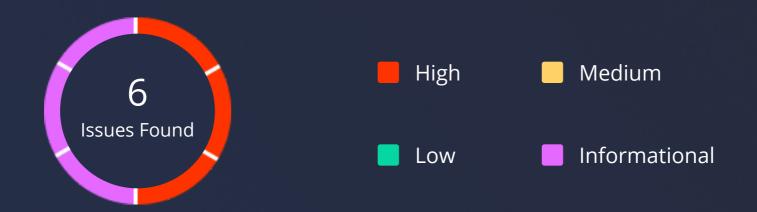

<u>cngn.sol</u>

**Branch** Main

Fixed In <u>397ff4f</u>

## **Number of Security Issues per Severity**

	High	Medium	Low	Informational
Open Issues	0	0	0	0
Acknowledged Issues	0	0	0	1
Partially Resolved Issues	0	0	0	0
Resolved Issues	3	0	0	2

cNGN - Audit Report

## **Checked Vulnerabilities**

Gas Limit and Loops

✓ DoS with Block Gas Limit

Transaction-Ordering Dependence

✓ Use of tx.origin

Exception disorder

Gasless send

✓ Balance equality

✓ Byte array

Transfer forwards all gas

ERC20 API violation

Malicious libraries

Compiler version not fixed

Redundant fallback function

Send instead of transfer

Style guide violation

Unchecked external call

Unchecked math

Unsafe type inference

Implicit visibility level

cNGN - Audit Report

## **Techniques and Methods**

Throughout the audit of smart contracts, care was taken to ensure:

- The overall quality of code.
- Use of best practices.
- Code documentation and comments match logic and expected behavior.
- Token distribution and calculations are as per the intended behavior mentioned in the whitepaper.
- Implementation of ERC-20 token standards.
- Efficient use of gas.
- Code is safe from re-entrancy and other vulnerabilities.

The following techniques, methods, and tools were used to review all the smart contracts.

#### **Structural Analysis**

In this step, we have analyzed the design patterns and structure of smart contracts. A thorough check was done to ensure the smart contract is structured in a way that will not result in future problems.

### **Static Analysis**

A static Analysis of Smart Contracts was done to identify contract vulnerabilities. In this step, a series of automated tools are used to test the security of smart contracts.

#### **Code Review / Manual Analysis**

Manual Analysis or review of code was done to identify new vulnerabilities or verify the vulnerabilities found during the static analysis. Contracts were completely manually analyzed, their logic was checked and compared with the one described in the whitepaper. Besides, the results of the automated analysis were manually verified.

### **Gas Consumption**

In this step, we have checked the behavior of smart contracts in production. Checks were done to know how much gas gets consumed and the possibilities of optimization of code to reduce gas consumption.

#### **Tools and Platforms used for Audit**

Hardhat, Foundry.

cNGN - Audit Report

#### **Types of Severity**

Every issue in this report has been assigned to a severity level. There are four levels of severity, and each of them has been explained below.

### **High Severity Issues**

A high severity issue or vulnerability means that your smart contract can be exploited. Issues on this level are critical to the smart contract's performance or functionality, and we recommend these issues be fixed before moving to a live environment.

## **Medium Severity Issues**

The issues marked as medium severity usually arise because of errors and deficiencies in the smart contract code. Issues on this level could potentially bring problems, and they should still be fixed.

### **Low Severity Issues**

Low-level severity issues can cause minor impact and are just warnings that can remain unfixed for now. It would be better to fix these issues at some point in the future.

#### **Informational**

These are four severity issues that indicate an improvement request, a general question, a cosmetic or documentation error, or a request for information. There is low-to-no impact.

## **Types of Issues**

## **Open**

Security vulnerabilities identified that must be resolved and are currently unresolved.

#### **Resolved**

These are the issues identified in the initial audit and have been successfully fixed.

## **Acknowledged**

Vulnerabilities which have been acknowledged but are yet to be resolved.

## **Partially Resolved**

Considerable efforts have been invested to reduce the risk/impact of the security issue, but are not completely resolved.

## **High Severity Issues**

#### 1. Blacklisted address is allowed to transfer tokens if allowance>0

#### **Path**

https://github.com/asc-africa/stablecoin/ blob/169aaecf4309a54022a9f05403645eb3614c0511/contracts/cngn.sol#L114

#### **Function**

transferFrom()

## **Description**

If a blacklisted function has allowance to transfer tokens of non-blacklisted address then it can transfer it using transferFrom function.

## Recommendation

Include a check to see if msg.sender is not blacklisted.

#### **Status**

Resolved

## 2. Any non-blacklisted address can transfer tokens to a blacklisted address

#### **Path**

https://github.com/asc-africa/stablecoin/

blob/169aaecf4309a54022a9f05403645eb3614c0511/contracts/cngn.sol#L97

https://github.com/asc-africa/stablecoin/

blob/169aaecf4309a54022a9f05403645eb3614c0511/contracts/cngn.sol#L114

#### **Function**

transfer(), transferFrom()

## **Description**

Any non-blacklisted address can send tokens to a blacklisted address.

#### Recommendation

Include a check to see if **to** address is not blacklisted.

#### **Status**

**Resolved** 

cNGN - Audit Report

## 3. The owner might mistakenly mint tokens to blacklisted address

#### **Path**

https://github.com/asc-africa/stablecoin/ blob/169aaecf4309a54022a9f05403645eb3614c0511/contracts/cngn.sol#L139

#### **Function**

mint()

## **Description**

The mint function does not check if the address passed is blacklisted or not. The owner might mistakenly pass a blacklisted address to it.

## Recommendation

Include a check to see if **\_mintTo** address is not blacklisted.

#### **Status**

Resolved

## **Informational Issues**

## 4. Experimental ABIEncoderV2 is deprecated

#### **Path**

https://github.com/asc-africa/stablecoin/ blob/4540e0958961307104265e0fdc4dd4449adbe614/contracts/cngn.sol#L5

## **Description**

Compiler version 0.8.0 and above support ABIEncoderV2 by default and experimental ABIEncoderV2 is deprecated. **Doc** 

#### Recommendation

Remove pragma experimental ABIEncoderV2;

#### Status

**Resolved** 

## 5. Use the latest compiler version

#### **Path**

https://github.com/asc-africa/stablecoin/ blob/4540e0958961307104265e0fdc4dd4449adbe614/contracts/cngn.sol#L4

## Description

Use the latest solidity compiler instead of 0.8.4 to avoid any security issues.

#### Recommendation

Replace 0.8.4 with 0.8.23

#### **Status**

**Acknowledged** 

## 6. Unused Reentrancy contract import

#### **Path**

https://github.com/asc-africa/stablecoin/ blob/4540e0958961307104265e0fdc4dd4449adbe614/contracts/cngn.sol#L11

## **Description**

Reentrancy guard is imported but not used anywhere, so it will just consume gas on deployment.

#### Recommendation

Remove the reentrancy guard from the contract as it is not required, as no external call is being made in the contract.

#### **Status**

**Resolved** 

## **Automated Tests**

No major issues were found. Some false positive errors were reported by the tools. All the other issues have been categorized above according to their level of severity.

## **Closing Summary**

In this report, we have considered the security of the cNGN Token Contract. We performed our audit according to the procedure described above.

Some issues of Medium, Low and informational severity were found, Some suggestions and best practices are also provided in order to improve the code quality and security posture.

## **Disclaimer**

QuillAudits Smart contract security audit provides services to help identify and mitigate potential security risks in cNGN smart contracts. However, it is important to understand that no security audit can guarantee complete protection against all possible security threats. QuillAudits audit reports are based on the information provided to us at the time of the audit, and we cannot guarantee the accuracy or completeness of this information. Additionally, the security landscape is constantly evolving, and new security threats may emerge after the audit has been completed.

Therefore, it is recommended that multiple audits and bug bounty programs be conducted to ensure the ongoing security of cNGN smart contracts. One audit is not enough to guarantee complete protection against all possible security threats. It is important to implement proper risk management strategies and stay vigilant in monitoring your smart contracts for potential security risks.

QuillAudits cannot be held liable for any security breaches or losses that may occur subsequent to and despite using our audit services. It is the responsibility of the cNGN to implement the recommendations provided in our audit reports and to take appropriate steps to mitigate potential security risks.

10

## **About QuillAudits**

QuillAudits is a secure smart contracts audit platform designed by QuillHash Technologies. We are a team of dedicated blockchain security experts and smart contract auditors determined to ensure that Smart Contract-based Web3 projects can avail the latest and best security solutions to operate in a trustworthy and risk-free ecosystem.
