## **Executive Summary**

Project Name FamilyMetaToken

Project Website <a href="https://www.familylinkmeta.com/">https://www.familylinkmeta.com/</a>

Twitter <a href="https://x.com/\_FamilyMeta">https://x.com/\_FamilyMeta</a>

Overview FamilyMetaToken is Erc20 Token Contract with upgradeability and

pausable functionalities

Timeline 3rd June 2024 to 7th June 2024

**Update Code Received** 11th June 2024

Second Review 12th June 2024

Method Manual Review, Functional Testing, Automated Testing, etc. All the

raised flags were manually reviewed and re-tested to identify any

false positives.

Audit Scope The scope of this audit was to analyse the Family Meta Token

Contract for quality, security, and correctness.

Source Code <a href="https://github.com/FamilyMeta-FAMA/FAMA">https://github.com/FamilyMeta-FAMA/FAMA</a>

**Contracts In-Scope** FamilyMeta.sol

**Branch** Main

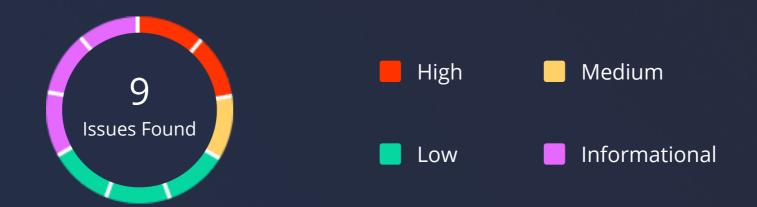

Fixed In <a href="https://github.com/FamilyMeta-FAMA/FAMA/commit/">https://github.com/FamilyMeta-FAMA/FAMA/commit/</a>

3358196adf85d1c0663147aef115443796fde3ca

Mainnet Address 0xB182b006e5b78b46E1c41F956973761ed5Cec22a

Family Meta - Audit Report

# **Number of Security Issues per Severity**

	High	Medium	Low	Informational
Open Issues	0	0	0	0
Acknowledged Issues	0	0	0	0
Partially Resolved Issues	0	0	0	0
Resolved Issues	2	1	3	3

Family Meta - Audit Report

## **Checked Vulnerabilities**

✓ Timestamp Dependence

Gas Limit and Loops

✓ DoS with Block Gas Limit

Transaction-Ordering Dependence

✓ Use of tx.origin

Exception disorder

Gasless send

✓ Balance equality

✓ Byte array

Transfer forwards all gas

ERC20 API violation

Compiler version not fixed

Redundant fallback function

Send instead of transfer

Style guide violation

Unchecked external call

Unchecked math

Unsafe type inference

Implicit visibility level

Family Meta - Audit Report

## **Techniques and Methods**

Throughout the audit of smart contracts, care was taken to ensure:

- The overall quality of code.
- Use of best practices.
- Code documentation and comments match logic and expected behavior.
- Token distribution and calculations are as per the intended behavior mentioned in the whitepaper.
- Implementation of ERC's standards.
- Efficient use of gas.
- Code is safe from re-entrancy and other vulnerabilities.

The following techniques, methods, and tools were used to review all the smart contracts.

## **Structural Analysis**

In this step, we have analyzed the design patterns and structure of smart contracts. A thorough check was done to ensure the smart contract is structured in a way that will not result in future problems.

## **Static Analysis**

A static Analysis of Smart Contracts was done to identify contract vulnerabilities. In this step, a series of automated tools are used to test the security of smart contracts.

### **Code Review / Manual Analysis**

Manual Analysis or review of code was done to identify new vulnerabilities or verify the vulnerabilities found during the static analysis. Contracts were completely manually analyzed, their logic was checked and compared with the one described in the whitepaper. Besides, the results of the automated analysis were manually verified.

### **Gas Consumption**

In this step, we have checked the behavior of smart contracts in production. Checks were done to know how much gas gets consumed and the possibilities of optimization of code to reduce gas consumption.

#### **Tools and Platforms used for Audit**

Hardhat, Foundry.

Family Meta - Audit Report

## **Types of Severity**

Every issue in this report has been assigned to a severity level. There are four severity levels, each of which has been explained below.

## **High Severity Issues**

A high severity issue or vulnerability means your smart contract can be exploited. Issues on this level are critical to the smart contract's performance or functionality, and we recommend these issues be fixed before moving to a live environment.

## **Medium Severity Issues**

The issues marked as medium severity usually arise because of errors and deficiencies in the smart contract code. Issues on this level could potentially bring problems, and they should still be fixed.

## **Low Severity Issues**

Low-level severity issues can cause minor impacts and are just warnings that can remain unfixed for now. It would be better to fix these issues at some point in the future.

#### **Informational**

These are four severity issues that indicate an improvement request, a general question, a cosmetic or documentation error, or a request for information. There is low-to-no impact.

## **Types of Issues**

## **Open**

Security vulnerabilities identified that must be resolved and are currently unresolved.

#### **Resolved**

These issues were identified in the initial audit and successfully fixed.

## **Acknowledged**

Vulnerabilities which have been acknowledged but are yet to be resolved.

## **Partially Resolved**

Considerable efforts have been invested to reduce the risk/impact of the security issue, but are not completely resolved.

## **High Severity Issues**

## 1. Failing changeOwnership function

#### **Path**

FamilyMetaToken

#### **Function**

changeOwnership

## **Description**

changeOwnership function is only callable by multisigWallet address to transfer the ownership to the new owner. This function utilizes Openzeppelin's transferOwnership function but it is only callable by the current owner not by the token contract. Therefore ownership is not changed.

```
/**
```

\* @dev Changes the ownership to a new address. Callable by multisig wallet. \* @param newOwner Address of the new owner.

\*/

function changeOwnership(address newOwner) external onlyMultisig nonReentrant {
 require(newOwner != address(0), "New owner cannot be zero address.");
 transferOwnership(newOwner); // @audit only callable by the current owner
}

#### **POC**

Below is the Foundry test which indicates that the call fails

```
function test_change_owner_error() public {
   address newOwner = makeAddr("newOwner");
   vm.prank(multisigWallet, multisigWallet);
   vm.expectRevert();
   familyMeta.changeOwnership(newOwner);
   // ownership is not transferred
   assertNotEq(newOwner, familyMeta.owner());
}
```

#### Recommendation

Consider to use the transferOwnership function directly (should be called by current owner).

Family Meta - Audit Report

#### **Status**

#### **Resolved**

## **QuillAudits' Team Comment**

FamilyMetaToken Team replaced the single-step changeOwnership function with a two-step ownership transfer mechanism using requestOwnershipTransfer and confirmOwnershipTransfer. Consequently, the transferOwnership function has been disabled to enforce the two-step process.

## 2. owner/multisigWallet can burn tokens while the contract is paused

#### **Path**

FamilyMetaToken

#### **Function**

Burn

## **Description**

The FamilyMetaToken contract can be paused and unpaused by the multisigWallet. burn function is not using the whenNotPaused modifier. When the FamilyMetaToken contract is paused, owner/multisigWallet address can burn user's FAMA tokens. Through this malicious owner can increase the price of the FAMA token.

```
// @audit whenNotPaused modifier is not used
function burn(address from, uint256 amount) external nonReentrant {
    require(amount > 0, "Burn amount must be greater than zero");
    require(msg.sender == multisigWallet || msg.sender == owner(), "Not authorized to burn");
    _burn(from, amount);
    emit Burned(from, amount);
}
```

Owner can also change ownership or authorize upgrade to new implementation while contract is paused.

#### Recommendation

Consider to add whenNotPaused modifier to the burn, \_authorizeUpgrade, changeOwnership and changeMultisigWallet function.

Family Meta - Audit Report

### **Status**

**Resolved** 

## **QuillAudits' Team Comment**

FamilyMetaToken added whenNotPaused modifier.

## **Medium Severity Issues**

## 3. ERC20 functionalities not paused/unpaused

#### **Path**

FamilyMetaToken

## **Description**

According to the FamilyMeta team, "Our intention in using PausableUpgradeable is indeed to allow us to pause and unpause ERC20 functionalities and other features". PausableUpgradeable's modifier (whenNotPaused) are not used to pause the ERC20 functionalities.

### **POC**

```
Below is the Foundry test as a PoC

function test_transfer_while_paused() public {
   address Alice = makeAddr("Alice");
   address bob = makeAddr("bob");
   vm.prank(owner, owner);
   // owner transfer 1000 FAMA to Alice
   familyMeta.transfer(Alice, 1000);

   vm.prank(multisigWallet, multisigWallet);
   // multisigWallet pauses the token functionalities
   familyMeta.pause();

   vm.prank(Alice, alice);
   // Alice can still transfer the tokens to bob
   familyMeta.transfer(bob, 1000);
   assertEq(familyMeta.balanceOf(Alice), 0);
   assertEq(familyMeta.balanceOf(bob), 1000);
}
```

#### Recommendation

Consider adding the whenNotPaused modifier to ERC20 functions (burn, transfer, allowance and other) by overriding them to prevent this from occurring while the contract is paused. Another way to solve this to use ERC20PausableUpgradeable instead of PausableUpgradeable and ERC20Upgradeable.

#### **Status**

#### Resolved

### **QuillAudits' Team Comment**

FamilyMetaToken team overridden the transfer, allowance, transferFrom, and approve functions to include the whenNotPaused modifier.

## **Low Severity Issues**

## 4. Use Ownable2StepUpgradeable instead of OwnableUpgradeable

#### **Path**

FamilyMetaToken

## **Description**

Token contract uses one-step ownership transfer through OwnableUpgradeable.

Two-step ownership transfer is preferable, where:

- The current owner proposes a new address for the ownership change.
- In a separate transaction, the proposed new address can then claim the ownership.

#### Recommendation

Consider doing two step owner transfer to be safe and secure using Ownable2StepUpgradeable

#### **Status**

**Resolved** 

## **QuillAudits' Team Comment**

FamilyMetaToken team implemented two-step ownership transfer.

#### 5. Mismatch of decimals value

#### **Path**

FamilyMetaToken

## **Description**

Based on the whitepaper, decimals for FAMA token is 8. But the token contract is using 18 decimals (Openzeppelin ERC20 tokens use this).

Family Meta - Audit Report

## Recommendation

Consider refactoring the token contract/whitepaper.

#### **Status**

**Resolved** 

## **QuillAudits' Team Comment**

FamilyMetaToken team changed the whitepaper.

## 6. Wrong Openzeppelin dependencies import path

### **Path**

FamilyMetaToken

## **Description**

Openzeppelin imports (ReentrancyGuardUpgradeable and PausableUpgradeable) in the contract use old paths. Changing the paths based on the new version of Openzeppelin is better otherwise there will be a compilation error.

### Recommendation

Consider changing paths of the imports in the contract.

#### **Status**

**Resolved** 

## **Informational Issues**

## 7. Already existing decimals function

#### **Path**

FamilyMetaToken

#### **Function**

decimal

## **Description**

decimals function in the contract overrides the openzeppelin's decimals function but logic is not changed. Token is initialized with 18 decimals by default which is returned by both versions of the function.

```
/ @audit overriding the function is not changing the logic
function decimals() public pure override returns (uint8) {
  return _decimals;
}
```

#### Recommendation

Consider to use the existing Openzeppelin's decimals function for better readability. Also reduces the contract size and complexity.

#### **Status**

**Resolved** 

## **QuillAudits' Team Comment**

FamilyMetaToken team removed the override of decimals function and used the default OpenZeppelin implementation.

Family Meta - Audit Report

## 8. Use underscores as separators

#### **Path**

FamilyMetaToken

## **Description**

In Solidity, you can use underscores as separators within numeric literals to make them easier to read. For example, 50000000000 can be made into 50\_000\_000\_000.

#### Recommendation

Consider to use underscores for better readability.

#### **Status**

Resolved

### **QuillAudits Team's Comment**

FamilyMetaToken team applied underscores to large numeric literals for better readability, e.g., 50\_000\_000\_000.

## 9. Use owner instead of multisigWallet

## **Description**

Based on the FamilyMeta team "for management optimization, we internally decided to treat the owner and the multisig wallet as the same". Contract uses both of these addresses.

#### Recommendation

Consider to use just owner throughout the contract and remove multisigWallet.

#### **Status**

#### Resolved

### **QuillAudits Team's Comment**

FamilyMetaToken team is using owner throughout the contract.

## **Automated Tests**

No major issues were found. Some false positive errors were reported by the tools. All the other issues have been categorized above according to their level of severity.

Family Meta - Audit Report

## **Closing Summary**

In this report, we have considered the security of the FamilyMeta Contract. We performed our audit according to the procedure described above.

Some issues of High, Medium, Low and informational severity were found, Some suggestions and best practices are also provided in order to improve the code quality and security posture. In the end, the Family Meta Team Resolved all Issues.

## **Disclaimer**

QuillAudits Smart contract security audit provides services to help identify and mitigate potential security risks in FamilyMeta smart contracts. However, it is important to understand that no security audit can guarantee complete protection against all possible security threats. QuillAudits audit reports are based on the information provided to us at the time of the audit, and we cannot guarantee the accuracy or completeness of this information. Additionally, the security landscape is constantly evolving, and new security threats may emerge after the audit has been completed.

Therefore, it is recommended that multiple audits and bug bounty programs be conducted to ensure the ongoing security of FamilyMeta smart contracts. One audit is not enough to guarantee complete protection against all possible security threats. It is important to implement proper risk management strategies and stay vigilant in monitoring your smart contracts for potential security risks.

QuillAudits cannot be held liable for any security breaches or losses that may occur subsequent to and despite using our audit services. It is the responsibility of the FamilyMeta to implement the recommendations provided in our audit reports and to take appropriate steps to mitigate potential security risks.

## **About QuillAudits**

QuillAudits is a secure smart contracts audit platform designed by QuillHash Technologies. We are a team of dedicated blockchain security experts and smart contract auditors determined to ensure that Smart Contract-based Web3 projects can avail the latest and best security solutions to operate in a trustworthy and risk-free ecosystem.

**1000+** Audits Completed
